

Engineering of Ancillary Services System for the Swiss Energy Market

Dr. D.Tchoubraev, Swissgrid AG, Senior member IEEE

Introduction of ancillary services market was a key task of the Swiss electric energy liberalisation. Those services, like frequency and voltage regulation, came under Swissgrid responsibility and the development of the new market management platform was started. This set of IT systems had to support all the new processes for the ancillary services, and must be developed within very short time. The challenges faced during the system implementation and the corresponding system engineering approaches will be presented in this talk, that will be followed by the visit to Swissgrid National Control Center.
