

Understand your Business Domain (Systems design using Metamodels)

Frank H. Ritz, Ritz Engineering GmbH

Metamodels are important to understand your business domain. They enrich the semantics of your specification objects by having them semantically connected.

Metamodels answer the questions on what and how a specification content has to be designed. Metamodels lead you to multidimensional specifications due to the fact that a relationship dimension has been added. The topic sysML/UML Metamodels covers the questions.

- what are sysML/UML Metamodels
- how they are made
- why they are important
- which areas of business are typical.
